

CS 330, Algorithm Syntax

In this file you can find examples of how to write algorithms in the LaTeX `algorithm2e` environment. (This environment is included in the preamble we gave.) You are not required to use this format, but it has a neat look and takes care of things like indentation.

Algorithm 1: AlgorithmSyntax(input)

```
/* you can add a comment here explaining the input. */
/* Use backslash tcc for the comment syntax. */
1  $x \leftarrow 8$ /* use the backslash gets command for the left arrow, meaning value
   assignment. */
2  $L \leftarrow$  empty list ;
3  $G \leftarrow$  empty hash table;
4 for condition do
    /* don't forget the brackets indicating the body of the loop */
5     do something;
6     for condition for nested loop do
7         /* nested loop has brackets too */
            do something;
8 if condition then
9     do something;
10 else if elseif condition then
11     do something ;
12 else
13     do something ;
14     do something else;
15 while condition do
16     do something;
17 return myoutput
```
